(13) Inventory Management :- Zepto | Amazon etc

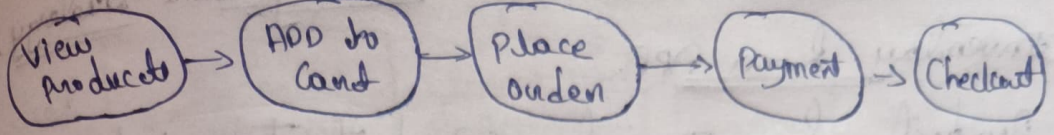

Objects

(1) USER (2) PRODUCTS (3) CART (4) ORDER (5) INVOICE
(6) PAYMENT (7) Inventory (8) warehouse (9) Location (10) A

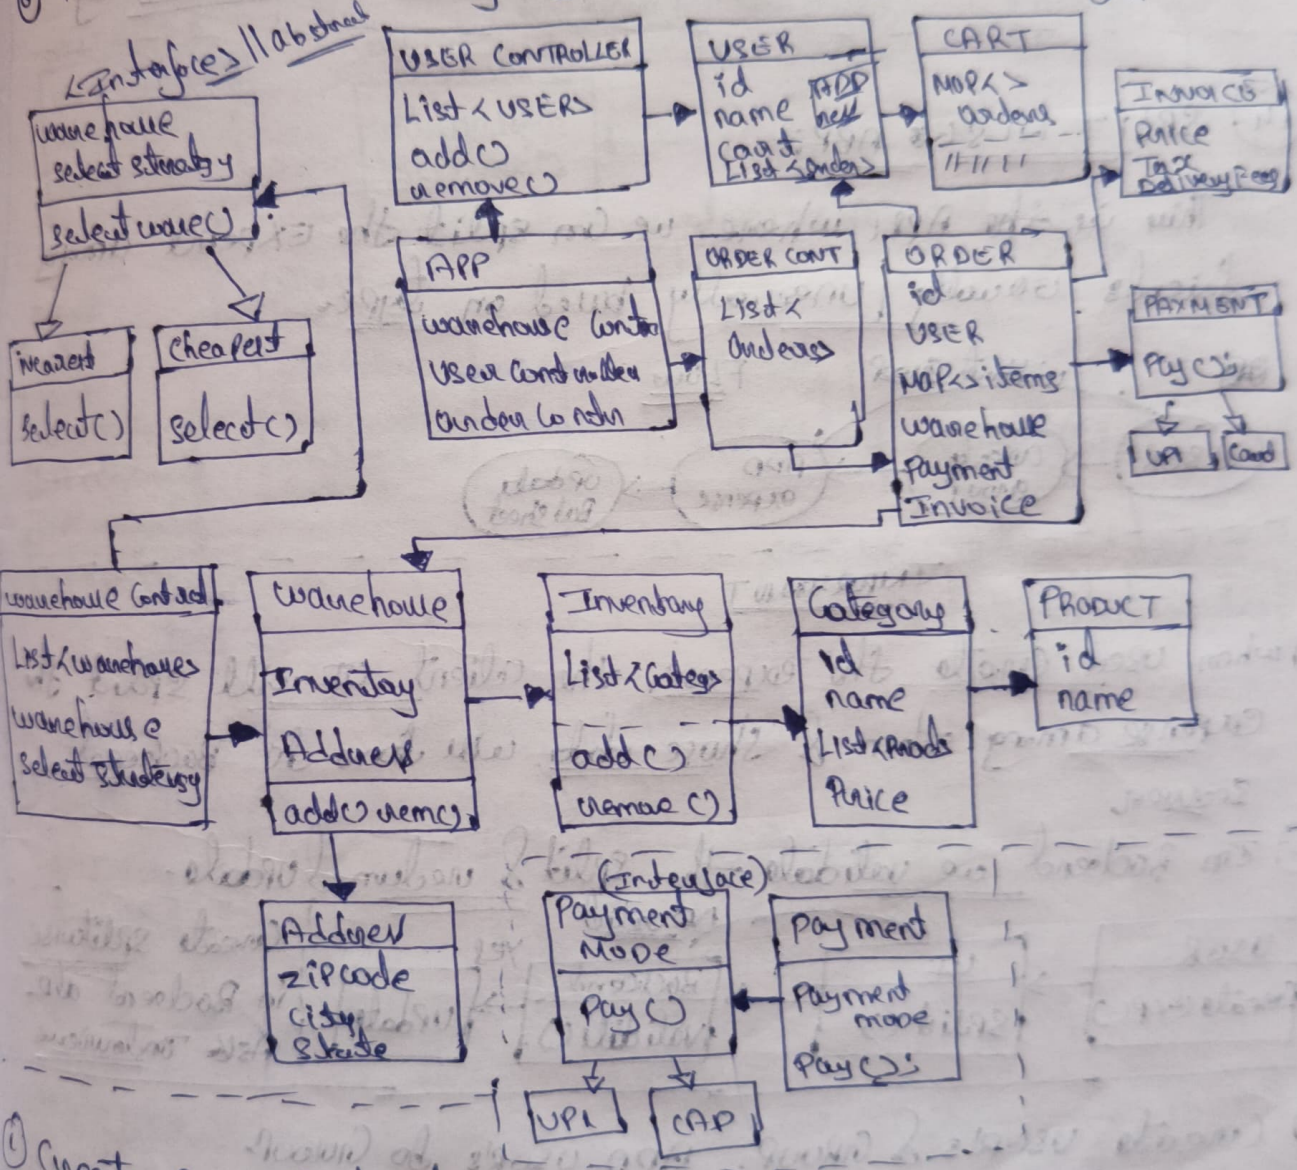

(1) Create some Products. P1, P2, P3, P4.
(2) Create Category & add Products to it
(3) Create Inventory & add all Categories to it
(4) Create some warehouse & using warehouse Controller store all warehouse.
(5) Create User & store all User in user List using Controller.

(13) Inventory Management :- Zepto | Amazon etc

Objects

(1) USER (2) PRODUCTS (3) CART (4) ORDER (5) INVOICE
(6) PAYMENT (7) Inventory (8) warehouse (9) Location (10) A

(1) Create some Products. P1, P2, P3, P4.
(2) Create Category & add Products to it
(3) Create Inventory & add all Categories to it
(4) Create some warehouse & using warehouse Controller store all warehouse.
(5) Create User & [illegible] view/list using Controller.

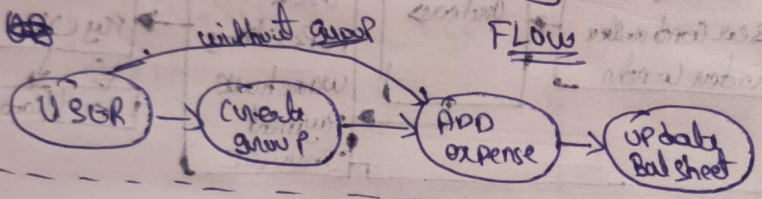

RUN FLOW

① Get user from APP. & get warehouse using some strategy.
③ Get inventory from APP.
④ Choose Product from inventory → Product Category List.
⑤ ADD item & quantity to Cart
⑥ Place order & Checkout. → Buy it & remove from inventory

---

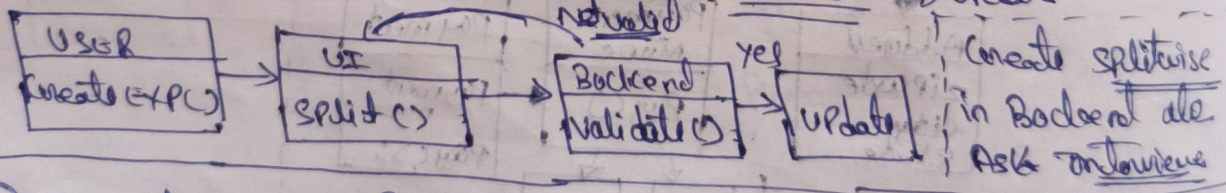

⑭ SPLIT WISE APP :-

This is the APP, where we can split the EXPENCE among friends equally / unequally based on type.

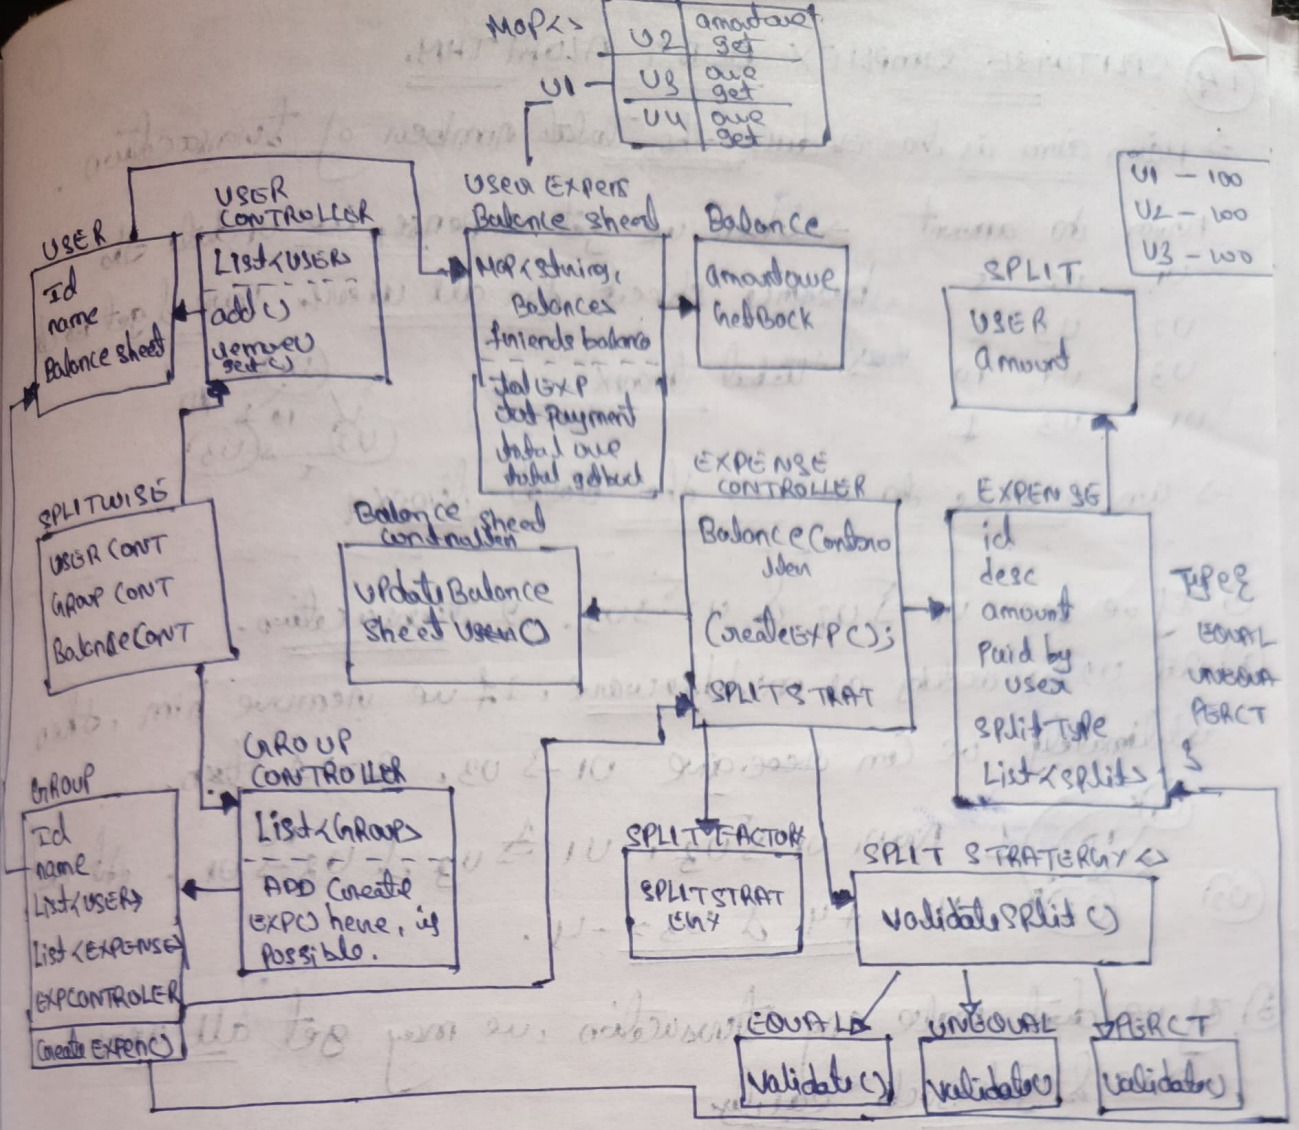

IMPORTANT

① when user Create the expense, the client UI will split the expense among them & those data will come to Backend server.
② In Backend we validate the split & return & update.

---

① Create USER's & GROUP. ADD USER's to Group
② Create SPLIT & expense. → It will Create EXP obj for us.
③ Based on SPLIT type, get Strategy & validate it.
④ once validate, update the Balance sheet based on right approach.

How Balance sheet updating

① Each user as Balance Expense sheet. They can see their total expense, payments, owe & getback. And also they can see other friends Balance, How much they need to give & he need to give them

② It is maintained using Map<String, Balance>. String = UId

EXPENSE 1

amount = 300. Paid = U1.

Split
- U1 100
- U2 100
- U3 100

U1
totalEXP = 300
payment = 100
owe = 0
getback = 200

U2	0	100
	90	
U3	0	100
	90	

U2

U1	0	100
	90	
U3	0	100
	90	

EXP = 100
Pay = 100
owe = 100
get = 0

① When we get Expense, we call updateBalance().

② Iterate over Map & get each USER 1 by 1.

③ For "Paid By USER", update total EXP, payment, owe, getback.

④ For remaining users, update owe & getBack
