⑩ FOOD ORDERING = SWIGGY / ZOMATO

① FOOD Manager → send notification to Restaurent with all dishes to prepare FOOD.

② Delivery Manager → Parallely send notification to Delivery Manager & assign the nearest Delivery partner with Restaurent name & Customer Details.

- - - - - - - - - - - - - - - - - - -

REQUIREMENTS

① USER ② Delivery Partners
③ Restaurent ④ Dishes, ⑤ Menu ⑥ Customize ADDONS
⑦ Location

- - - - - - - - - - - - - - - - - - -

→ used Strategy Manager → Based on some rules, there are different strategy to assign delivery partner

→ we call Strategy Manger (new LocationBased);

→ And call assignDeliveryPartner().

- - - - - - - - - - - - - - - - - - -

WHY WE USED Strategy Manager

WITHOUT :- new DeliveryManager (LocationBased Strategy).

Manager class = Factory / Controller, decide at Run time which strategy to be used.

```
Strategy Manger {
    DM determine Partner(details){
        condition //
            return new LOCation / Ratis
    }
Del MGR {
    Strategy Manager. Match Partner ()
}
```

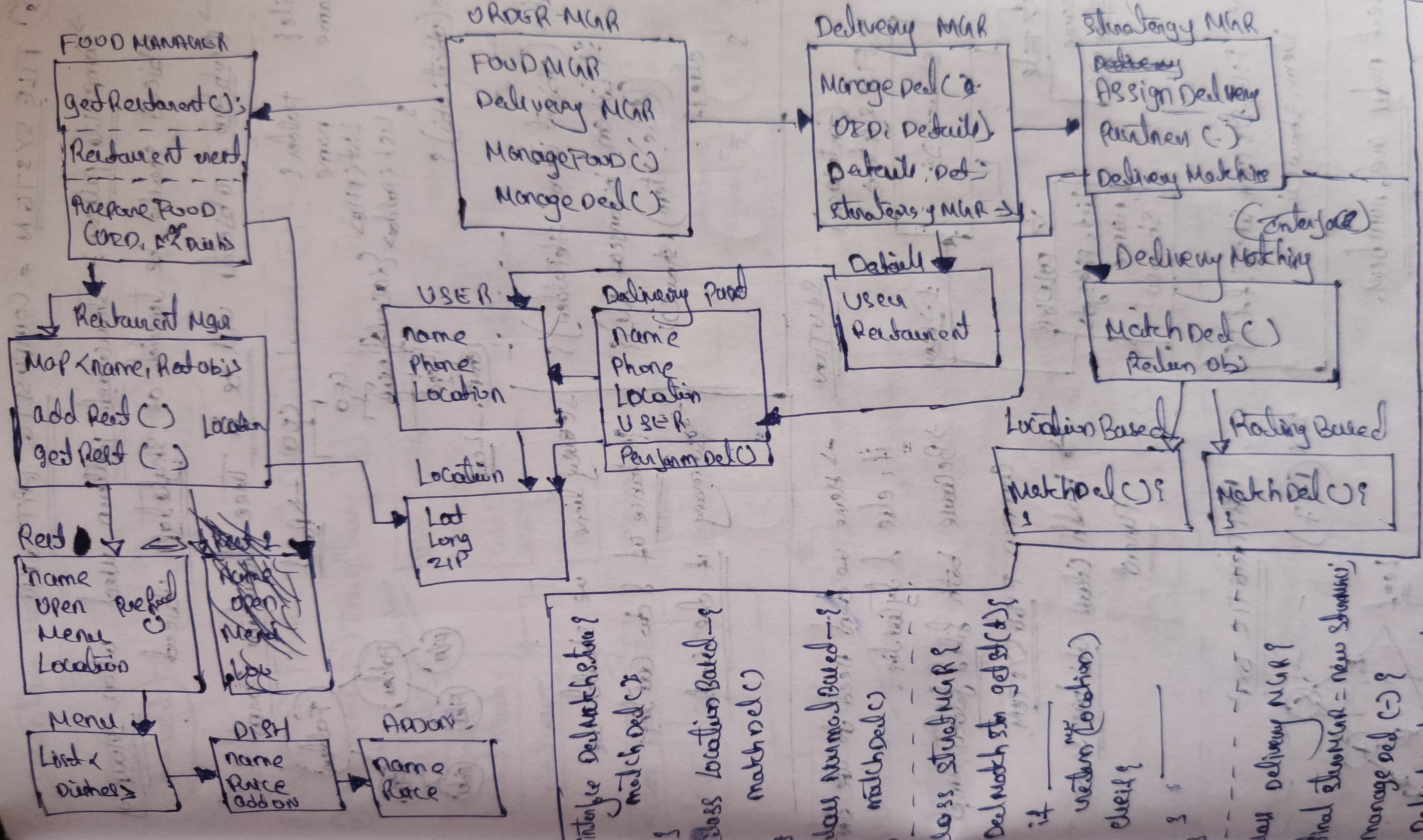
① ORder MGR send Detail to Del MGR. and DMG get one strategy & call matchdel()

② Then it gets List of DelPart

③ Then based on Logic any one Partner is called and ~~[illegible]~~ get PerfourmDel().

- - - - - -

→ Strategy MGR == Factory



```
interface DelMatchStrategy {
    matchDel();
}
class LocationBased -- {
    matchDel()
}
class NormalBased -- {
    matchDel()
}
- - - - - - - - - - - - -
class StratMGR {
    DelMatchStr getSt(t){
        if ______
            return new (Location)
        elseif {
            ______
        }
    }
}
- - - - - - - - - - - - -
class DeliveryMGR {
    final StraMGR = new StraMGR();
    manageDel (-) {
        DelMatch stra $ = straMGR.getSt(type);
        s.matchDel()
    }
}
- - - - - - - - - - - - -
    ORDER MGR (Main)
Delivery MGR DM = new DMGR()
Dm.
```

* Note:- Order manager can send only order details. Delivery MGR can get any strategy based on some Logic also
